

Changing Earth's Surface

Weathering • Erosion • Deposition

1 Weathering

Rocks break into smaller pieces.

Rocks are broken down by water, ice, wind, or changes in temperature.

2 Erosion

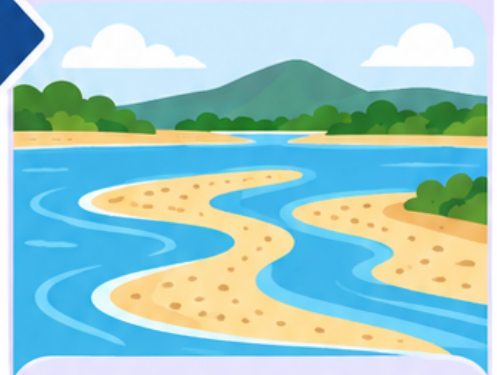

Wind, water, or ice carries the pieces away.

The pieces are moved from one place to another.

3 Deposition

The pieces are dropped in a new place, forming sandbars, deltas, or other landforms.

When the moving water, wind, or ice slows down, it drops the pieces.

Earth's surface can change fast or slow!

Fast Changes

Earthquakes and volcanoes can change the land in hours, days, or years.

Slow Changes

Rivers, wind, and waves can carve new landforms over a long time — like a canyon (thousands to millions of years).

Break it → move it → drop it.
