

Fraction Operations

Add • Subtract • Multiply • Divide

1 Add / Subtract

Common denominator first.

$$\frac{1}{4} + \frac{2}{4} = \frac{3}{4}$$

2 Multiply

Multiply across.

$$\frac{2}{3} \times \frac{3}{5} = \frac{6}{15} = \frac{2}{5}$$

3 Divide (KCF)

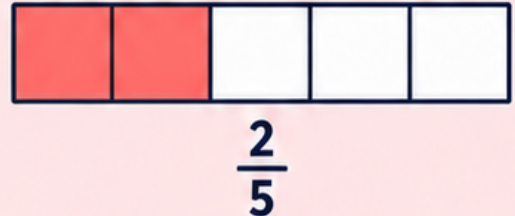

Keep • Change • Flip.

$$\frac{1}{2} \div \frac{1}{4} = \frac{1}{2} \times \frac{4}{1} = 2$$

4 Simplify

Divide top and bottom by the GCF.

$$\frac{6}{15} = \frac{6 \div 3}{15 \div 3} = \frac{2}{5}$$

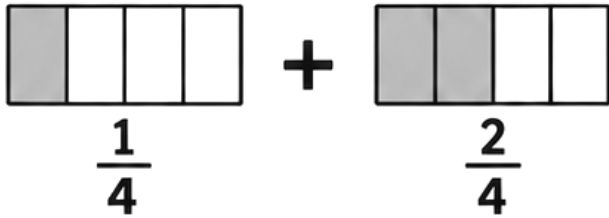

Add/subtract need a common denominator — multiply/divide do not.
