

Metals, Nonmetals, and Metalloids

Compare common properties

Metals

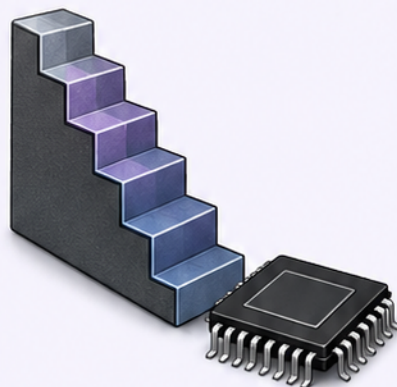

- Usually shiny
- Good conductors
- Often bendable
- Many are solid at room temperature

Nonmetals

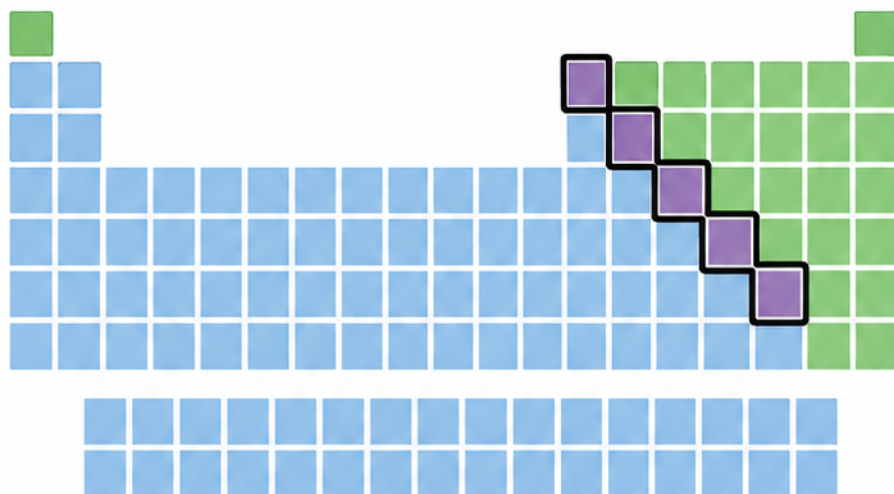

- Often dull
- Poor conductors
- Many are brittle if solid
- Some are gases at room temperature

Metalloids

- Share properties of metals and nonmetals
- Can be shiny or dull
- Often brittle
- Useful as semiconductors

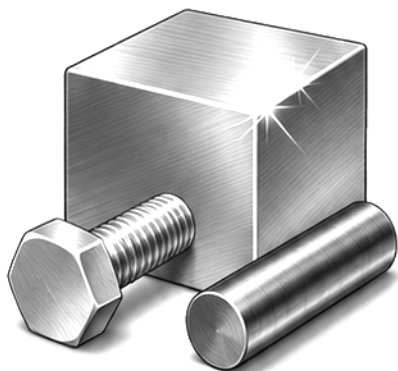

← Metalloids are often found along the **stair-step line** of the periodic table.
